Date:

Project: ServiceNow Incident Management — Client Scripts & UI Policies

Persona: ITIL Incident Agent / Service Desk Analyst

Stages	1. ENTICE <i>Awareness & Trigger</i>	2. ENTER <i>Initial Access & Input</i>	3. ENGAGE <i>Core Processing</i>	4. EXIT <i>Submission & Wrap-up</i>	5. EXTEND <i>Post-Action & Audit</i>
Steps What does the user experience at each phase?	Outage Reported Agent receives incident alert or phone call regarding system outage.	Open Incident Form Navigates to ServiceNow Incident portal and creates new record.	Select Impact & Urgency Agent modifies Impact to High (1). UI Policy instantly mandates Assignment Group.	Submit Record Agent clicks Save/Submit. `onSubmit` Client Script executes full form validation.	List View Verification Triage leads review incidents list. `onCellEdit` prevents unauthorized state jumps.
Interactions & Touchpoints Digital touchpoints, places, & people	Touchpoint: Email alert / Monitoring tool. People: End user reporting issue.	Touchpoint: ServiceNow Incident Form (`incident.do`). System: `onLoad` Client Script.	Touchpoint: Form Dropdowns & Banners. System: `onChange` Script & UI Policy.	Touchpoint: Form Header Action Buttons. System: `onSubmit` Script validation pop-up.	Touchpoint: Incident List View / Dashboard. System: `onCellEdit` script validation.
Goals & Motivations Primary goal or motivation ("Help me...")	"Help me quickly log critical tickets without missing key context."	"Help me see clear mandatory fields so I don't submit incomplete tickets."	"Help me route High Impact issues to the right group immediately."	"Help me confirm that all SLA data is valid before saving."	"Help me maintain strict compliance during list updates."
Positive Moments Enjoyable, productive, delightful steps	Clean portal layout makes starting a new ticket effortless.	Auto-filled caller details save time during initial triage.	Dynamic UI policy clearly highlights missing required fields in red.	Instant feedback pop-up confirms all business rules passed.	Accurate priority metrics across all list views without bad data.
Negative Moments Frustrating, confusing, or costly steps	Unclear incident impact level provided by callers over phone.	Cluttered form fields cause momentary cognitive overload.	Forgetting assignment group causes form save rejection.	Accidental submission without work notes blocks workflow.	Attempting list-view edits fails when unauthorized state selected.
Areas of Opportunity Ideas to make each step better	Implement AI smart-category suggestions based on ticket description.	Use `onLoad` scripts to hide irrelevant fields for standard users.	Add auto-assignment rules when Impact = High and Category = Database.	Provide actionable error messages detailing exact missing fields on `onSubmit`.	Build `onCellEdit` custom prompt guiding agents to open the full form.
